

EyeCommand

EyeCommand is a Command & Control (C4I) suite that gives military forces complete information superiority on the battlefield.

EyeCommand

Fully-compliant with NATO-standards and designed in conjunction with military experts, EyeCommand provides enhanced situational awareness across all levels of the command chain, providing a common operational picture that enables faster and better decisions in the heat of battle. EyeCommand is designed with a specific focus on combat functions, providing vital guidance to field artillery, cavalry, close air support and reconnaissance.

HOW IT WORKS

EyeCommand is a flexible and scalable C4I suite made up of three unique, integrated platforms. Military organisations can combine all of these platforms, for maximum strategic effectiveness, or take a one-platform-at-a-time approach to assist with their tactical operations.

VANTAGE

Designed for battalion level and above, providing headquarters with command & control, information superiority and communication tools, such as Tactical Data Links and ISTAR capabilities. EyeCommand Vantage allows for accurate, quick decisions and complete mastery of military operations. It is an individual tool when it comes to easily sharing vital information with coalition partners and relevant government and civil organisations, such as health agencies.

BATTLEFRONT

Designed to support company and platoon levels of the command chain and optimised for use on board vehicles. EyeCommand Battlefront offers extensive support of features for infantry, cavalry, artillery and reconnaissance. Powerful tactical communication supports real-time location identification of friendly troops and enemies, ensuring maximum force protection, even in the most extreme and challenging combat conditions.

GROUNDFORCE

Simple to use and designed to support dismounted soldiers engaged in operations. EyeCommand Groundforce provides friendly-force tracking, situational awareness and advanced digital communication functions that facilitate complex manoeuvres and real-time operational commands. Optimised for lightweight devices and small screens.

THE BIGGER PICTURE

Traditional operation systems and technologies can be cumbersome and provide only a localised picture of what's happening on the battlefield. They often don't seamlessly integrate with one another, operating in silos and failing to share vital information across vertical and horizontal command levels. This provides a less-than-accurate picture of the battlefield, and decisions are based on incomplete and dated information. Ultimately, this risks force protection.

With EyeCommand, the battlefield is fully-digitised, providing information superiority and an up-to-date picture that's tailored for each military command level, coalition partner and non-military organisation. At all times, there is an accurate and real-time operational picture of the battlefield and EyeCommand makes it easy to record, filter and share information across the full operations and support network.

EVERY SECOND COUNTS

When assessing mission operations and issuing commands, military forces have tended to rely on radio and voice technologies, as well as manual interventions, all of which can be slow and inefficient.

Information is often static, and updates come at irregular intervals using costly and time-consuming systems like Satcom and MANETs.

With EyeCommand, ease and speed of use is built in by design. Strategic and operational commands can be issued in real-time using an

easy-to-use interface that's been designed in close cooperation with military experts. For added speed, EyeCommand is useable from day one with just one hour of training. It also makes use of the latest automation technologies, providing the ability to toggle between manual and automatic responses to key situations. The result: fast operational deployment and reaction times plus tactical agility that - in the heat of the battle - saves lives.

CHANGES MADE EASY

Budget squeezes and prior investments in legacy infrastructure mean that updating systems can seem prohibitive and disruptive. On top of this, established military training programmes and operational procedures only increase the reluctance to change.

EyeCommand is built in a way that addresses these concerns. The system is designed to offer the flexibility of a gradual, incremental adoption if required and can be introduced one echelon at a time. Unlike other closed-systems, EyeCommand can be integrated on top of existing systems, equipment and software, protecting prior investments. It is also designed to be very low-maintenance.
